

I used a navbar which has a link to other html files; home, list and animation. Each files includes different property. The commonly used is Flexbox as it can be used in any mode. For example adjusting rows or columns, texts and spacing around texts. By using correct HTML format with good CSS styling, one can create proper web pages even in responsive and even without JavaScript. A browser can understand in an order like how to display text or load images or add elements etc..There are many advantages of using responsive web design. This attracts easily. CSS media queries adjusts layout for mobiles, tabs which is really good. It has a consistent manner with various designs. The disadvantage with this is we cannot get to know the result everytime unless we reach mobile mode..
